

**Canandaigua Town Board
Meeting Agenda
June 6, 2017
11:00am**

- Call To Order and Pledge of Allegiance
 - Pledge led by Kevin Reynolds, Town Board member
- Roll Call
 - Town Clerk Confirmation meeting was properly advertised
- Circulation of Written Communications and Correspondence
- Privilege of the Floor
- Presentations
- Public Hearings
- Priority Business
- Privilege of the Floor
- Resolutions

RESOLUTION NO. 2017 – 210: SETTING A PUBLIC HEARING ON PROPOSED IMPROVEMENTS TO CANANDAIGUA – FARMINGTON CONSOLIDATED WATER DISTRICT PURSUANT TO SECTION 202-B

WHEREAS, the Town Board of the Town of Canandaigua, after due deliberation, finds it in the best interests of the Town to schedule a public hearing to solicit public comment upon proposed improvements to the Canandaigua-Farmington Consolidated Water District pursuant to Section 202-b of the New York State Town Law; and

WHEREAS, MRB Group has prepared a map, plan and cost estimate, dated July 2016, showing the proposed improvements consisting of the replacement of the existing Brickyard Road water storage tank, located on Brickyard Road in the Town of Canandaigua, New York, with an elevated storage tank that includes a mixing system and the construction of a dedicated transmission main and valve vaults that connect the new tank to hydraulic grade Zone 2A. This water storage tank as well as the water main on Brickyard Road have reached the end of their useful lives. Replacing the tank and constructing a dedicated transmission main will:

1. improve system performance by buffering peak hour and fire demand;
2. reduce wide changes in system pressure during normal daily changes in demand;
3. provide additional storage for fire demands; and,
4. improve tank water quality by promoting flow through and mixing in the tank.

; and

WHEREAS, the plan shows the estimated costs of these 202-b improvements to be \$9,036,000.

NOW, THEREFORE, BE IT RESOLVED, that the Town Clerk be, and she hereby is, directed to schedule a public hearing, to be held on June 19, 2017, at 6:00 p.m. at the Canandaigua Town Hall, 5440 Route 5 & 20 West, lower level meeting room, Canandaigua, NY 14424.

- Privilege of the Floor
- Executive Session, as requested
- Adjournment

Canandaigua-Farmington Consolidated Water District

The following is an excerpt from the New York Education Law Article 145 Section 7209 and applies to this document.

"It is a violation of this law for any person unless he is acting under the direction of a Licensed Professional Engineer or Land Surveyor to alter an item in any way. If an item bearing the Seal of an Engineer or Land Surveyor is altered, the Altering Engineer or Land Surveyor shall affix to the item his Seal and the Notation 'Altered By' followed by his signature and the date of such alteration and a specific description of the alteration".

EXECUTIVE SUMMARY

Past studies of the Canandaigua-Farmington Consolidated Water District (CFWD), including the *Master Plan for the Canandaigua Farmington Water District* (MRB Group, 2002), identified a need to make improvements in the distribution system to better utilize the Brickyard Road Tank. Improvements are needed due to changes in the CFWD and City of Canandaigua distribution systems that affect the performance of the tank. Development changes by the Town of Canandaigua, including the creation of the Padelford Brook Greenway have also changed the ability to implement the recommendations of the 2002 Master Plan. This report reviewed alternatives to improve system and tank performance based on existing conditions and current development trends.

The recommended Alternative includes the following improvements: 2.0 million gallon elevated storage tank with mixing system, 16-inch transmission main on Brickyard Road from Yerkes Road to Canandaigua Farmington Town Line (CFTL) Road, 16-inch transmission main along CFTL Road to near Spartan Drive, parallel 16-inch tank inlet and outlet lines, tank valve vault with altitude valve and check valves, valve vault on Canandaigua Farmington Town Line Road (CFTL) near the east side of Stablegate, and valve vault at the intersection of Brickyard Road and Purdy Road. The project also includes the following incentive zoning improvements: 12-inch water main on CFTL Road and New Michigan Road, a pressure reducing/pressure sustaining valve and vault on CFTL Road near Stablegate Drive, and a pressure reducing/pressure sustaining vault on New Michigan Road at County Road 41. These improvements are anticipated to provide a benefit to the overall CFWD.

The recommended Alternative creates a new hydraulic grade zone, Zone 2A. The transmission main connects the tank to Zone 2A through a new pressure reducing valve and vault on CFTL Road, east of Stablegate. Flow to Zone 2A is through a dedicated transmission main from the new tank. The tank valve vault will also be modified to allow the tank to supplement high demands in Zone 1.

The probable project budget is currently \$9,036,000. The anticipated annual debt service cost per single family residence ranges from \$56.57 at 3% interest rate to \$68.07 at 4.5%.

(This page left blank.)

PRIORITY RANKING SYSTEM SCORE

The following is a summary of probable scoring for the proposed project and is based on the *Project Priority Ranking System for the Drinking Water Revolving Fund (DWSRF)*. In our opinion the project should receive a project ranking score of at least 125.

Technical Factors

A. MCL/Treatment Technique Violations

1. Microbiological 0
2. Organics 40
 - *Age of water in tank results in high potential for disinfection byproducts formation.*
 - *Weekly testing of fire pumps by local industry draws the older water into the system resulting to lower quality water within the distribution system.*
 - *Project includes in-tank treatment system utilizing spray-aeration to reduce disinfection byproducts.*
3. Lead and Copper/Corrosion 0
4. Radiological 0
5. Inorganic/Physical 0

B. Non-Treatment Sanitary Code Violations

1. Inadequate Source Capacity 0
2. Inadequate Distribution Pressure 25
 - *Weekly testing of fire pumps by a local industry drops system pressures to below 20 psi for the duration of the test.*
 - *Project includes the creation of a new hydraulic grade zone that increases system pressures in the zone that are higher than DOH allowed minimums.*
3. Uncovered Finished Water Storage.....25
 - *Penetrations in the cover of the tank provide direct access to the stored water from the outside.*

C. System Reliability/Dependability

1. Treatment Facility Replacement 0
2. Upgrade, replace and/or install vulnerable system components 10
 - *Water storage tank critical for providing supplemental flow during fire demands.*

- Existing tank locked out of system allowing wide pressure swings in the distribution system.	
- Existing system pressures drop below DOH standards when local industry tests fire pumps on a weekly basis.	
3. Aged mains and appurtenances	5
- Tank is at the end of its useful life. Inspection found holes in the cover and areas of heavy corrosion on the interior of the tank.	
- Water main on brickyard road has reached the end of its functional life and needs replacement in order to improve system reliability.	
4. Redundancy of Critical Components	0
5. Asbestos main replacement	0
6. Control/automation.....	5
- Project adds control valves to regulate flow between adjacent pressure zones.	
- SDADA system for tank level monitoring to be updated as part of the project.	
7. Inadequate source capacity which is not a public health hazard	5
- Existing tank being locked out of the system reduces the flow available for fire protection.	
D. Governmental Needs	
1. Serve contaminated private wells.....	0
2. Consolidation of water systems.....	0
3. Sole source aquifer dependent.....	0
4. Written commitment of funding.....	0
5. Consistent with Water Resources Management Strategy.....	5
- Project has been identified as a need in the 2002, <u>Master Plan for the Canandaigua Farmington Water District</u> .	
6. Operational changes	5
- Project includes modifications to the tank inlet and outlet lines to facilitate flow through the tank, which decreases water age in the tank which induces mixing and improves overall system water quality.	
TOTAL SCORE.....	125

I. PROJECT PLANNING

Town of Farmington identified a need to make improvements to Canandaigua-Farmington Consolidated Water District (CFWD or District) distribution system in order to better utilize the Brickyard Road Tank. The tank is normally locked out of the system and needs repairs.

A. LOCATION

The CFWD includes three hydraulic grade zones. Zone 1 is the area south of CFTL Road, west of County Road 8 and south of County Road 41, east of County Road 8. Zone 2 is the area between CFTL Road and County Road 41, west of County Road 28. And Zone 3 is generally the area north of County Road 41.

Figure 1 shows the existing CFWD and portions of adjacent water systems. Figure 2 shows the location of the Brickyard Road tank and transmission main improvements, which are located in Zone 1.

B. ENVIRONMENTAL RESOURCES PRESENT

Figure 3, shows the environmental resources in the area of the project.

Padelford Brook crosses Brickyard Road approximately 2,100 feet north of the tank site and will be crossed by the proposed transmission main. DOH and DEC guidelines will be followed for stream crossings.

Environmental mapping of the area indicates that wetland CG-11 follows Padelford Brook and extends roughly 540 feet to the north and 680 feet to the south along Brickyard Road. Wetland CG-11 was previously disturbed for construction of Brickyard Road an existing water main. The proposed transmission main will run parallel to Brickyard Road inside the existing right-of-way, DEC guidelines will be followed for work within and adjacent to wetlands.

The project is in the area of a principle aquifer however the project does not draw water from the aquifer. The comparatively shallow depth of the water main will not encroach on the aquifer.

The existing tank and water main along Brickyard Road are located within the Town of Canandaigua Padelford Brook Greenway, an area created by the Town of Canandaigua in 2015 that is identified as being agriculturally significant. The area includes designated agricultural

district, ONTA001. An existing water main on Brickyard Road already crosses and provides water to parcels along Brickyard Road within agricultural district ONTA001. The transmission main included in the project does not change the availability of public water within the agricultural district.

C. POPULATION TRENDS

United States Census data from 1970 to 2015 for Ontario County, Town of Farmington and Town of Canandaigua are summarized in Table 1. Census data shows a significant growth in the Towns of Farmington (3.6x) and Canandaigua (2.0x) from 1970 to 2015, with the County having moderate growth (1.4x).

Table 1 – US Census Population

Year	Farmington			Canandaigua			Ontario County		
	Population	10-Year	From 1970	Population	10-Year	From 1970	Population	10-Year	From 1970
1970	3,565			5,419			78,849		
1980	8,933	151%	151%	6,060	12%	12%	88,909	13%	13%
1990	10,381	16%	191%	7,160	18%	32%	95,101	7%	21%
2000	10,585	2%	197%	7,649	7%	41%	100,224	5%	27%
2010	11,825	12%	232%	10,020	31%	85%	107,931	8%	37%
2015 ¹	12,967	10% ²	264%	10,549	5% ²	95%	109,561	2% ²	39%

Notes: 1. US Census Estimate

2. 5-year growth.

3. 151% = 2.51x growth factor.

As shown in Figure 1, CFWD encompasses the Town of Canandaigua, north of the City and Canandaigua, and the entire Town of Farmington. Town of Canandaigua has multiple water districts with the largest being to the west of the City of Canandaigua.

The US Census 2015 population estimates show that the population of Farmington increased by 9.7% since the 2010 Census. If this growth rate continues for the next 5 years, it is possible that by the 2020 Census that the population will grow by over 20%. Similarly, it is likely that the population in Canandaigua may grow by over 10% by 2020. In contrast, the County population is likely to grow by 3.0%. Most of the population growth in both Towns was in areas with access to public water. Growth in Canandaigua, within the CFWD, is limited by congruent agricultural district (ONTA001).

The Cornell University Program of Applied Demographics (PAD) estimates population growth in Ontario County to range from 1.7% to 0.5% every 5-years through 2040 (Table 2). The projected growth from 2010 to 2020 is 3.3%. These growth rates are based on a study of birth rates, death rates and projections of migration into and out of the area, which can be effected by several socio-economic factors. The study is not broken down by Town, only by County.

Table 2 - Cornell PAD Estimates

Year	Ontario County		
	Population	Previous	From 2010
2010	107,931		
2015	109,618	1.56%	1.56%
2020	111,494	1.71%	3.30%
2025	113,164	1.50%	4.85%
2030	114,385	1.08%	5.98%
2035	115,165	0.68%	6.70%
2040	115,709	0.47%	7.21%

PAD estimates show a steady decrease in County growth rate for each 5-year period. Consideration was given to utilizing County growth rates to estimate future populations in each Town. However, given the historical growth rates in both Towns from 1970 to 2015, it was decided to use the average growth rate for each community from 1980 to 2015 adjusted to a 5-year basis. For Town of Farmington the estimated 5-year growth rate is 6.0%; 8.1% for Town of Canandaigua; and 2.9% for Ontario County. The growth rate from 1970 to 1980 was not included since the population in Farmington more than doubled (2.5x); a rate that has not been documented since 1980. Table 3 shows projected populations based on the calculated 5-year average historical growth rates. The table shows that the population of Town of Farmington may grow by 34% by 2040; Town of Canandaigua may grow by 48%.

D. COMMUNITY ENGAGEMENT

CFWD is administered by Town of Farmington with debt service and operation and maintenance fees paid for through each consumers' water bill. The project considers upgrades to the existing distribution system, necessary transmission lines and replacement of an existing tank. These improvements are a benefit to the entire district.

Table 3 - Future Population Estimates

Year	Farmington	Canandaigua	County
2010	11,825	10,020	107,931
2015	12,967	10,549	109,561
2020	13,742	11,407	112,699
2025	14,564	12,336	115,926
2030	15,434	13,339	119,246
2035	16,357	14,425	122,661
2040	17,335	15,599	126,174

Since CFWD encompasses the Town of Farmington and portions of the Town of Canandaigua, public participation will be sought from both communities. Participation will include meetings with CFWD, who will interface with the respective Town Boards. CFWD and the respective Town Boards will schedule public hearings to solicit direct community input regarding the project.

II. EXISTING FACILITIES

A. LOCATION MAP

Figure 1 shows the CFWD and portions of adjacent water systems. CFWD includes three hydraulic grade zones (Figure 1). Zone 1 is the area south of Canandaigua Farmington Town Line (CFTL) Road, west of County Road 8 and south of County Road 41, east of County Road 8. The typical hydraulic grade in Zone 1 is elevation 957 and is controlled by the water level in the City of Canandaigua tanks located west of the City water treatment plant on West Lake Road (County Road 6). The Brickyard Road tank is located in Zone 1.

Zone 2 is the area between CFTL Road and County Road 41, west of County Road 28. The hydraulic grade in Zone 2 is typically 860 and is controlled by pressure reducing valves on Route 332 and County Road 8.

Zone 3 is generally the area north of County Road 41. The hydraulic grade in Zone 3 is typically elevation 803 and is controlled by combination pressure reducing/sustaining valves on Route 332, CR 8 and Running Brook Road, and a pressure reducing valve on County Road 28 at Shortsville Road. Currently there is a closed valve on New Michigan Road that separates Zone 2 from Zone 3. Consistent with the 2002 *Water System Master Plan*, a new pressure reducing/sustaining valve will be installed on New Michigan Road at County Road 41 to interconnect Zones 2 and 3.

Figure 2 shows the location of the proposed project.

B. HISTORY

Canandaigua Farmington Water District was originally established in the 1960's and expanded over the years through the water district creation process. In 2003, Town of Farmington consolidated Canandaigua Farmington Water District, Risser Road Water District Extension, North and Andrews Road Water District Extension, Emerson and Allen Road Water District Extension, North Farmington Water District, Fox Road Water District Extension, Ellsworth Road Water District Extension, Sheldon Road Water District Extension and Maxwell Road Water District of the Town of Farmington into one consolidated water district designated as the Canandaigua-Farmington consolidated water District. Since 2003 the CFWD has expanded as developments are added to the District. The most recently proposed district extension is the New Michigan Road Water District Extension (being formed as of July 2016). Figure 1, in Appendix A, shows the existing water district.

Currently the District contains a mixture of asbestos cement pipe, cast iron pipe and ductile iron pipe, meter and valves vaults, and two water storage tanks.

In 1989, Town of Farmington developed a *Water System Master Plan* to aid in development and provided recommendations for system improvements. The *Water System Improvement Master Plan* was updated in 2002 to address growth in the system, update the status of the 1989 recommended improvements, and identified additional improvements needed due to system growth.

Town of Farmington refers to the 2002 Master Plan on a regular basis when reviewing proposed developments within the Town to assure conformance with the plan. One improvement identified in the 2002 Master Plan, *New Michigan/Yerkes Road Transmission Main*, was given priority status and is utilized to guide development along New Michigan Road, between Canandaigua Farmington Town Line Road (CFTL Road) and County Road 41, and along CFTL Road from New Michigan to Stablegate Drive. The intent of the improvement was to increase the capacity of the water system and to convey flow to high demand areas along Rt. 332 and Route 96 to the north.

Several changes have occurred since the 2002 Master Plan that affect the proposed *New Michigan/Yerkes Road Transmission Main* improvements. These changes include:

1. Incentive zoning agreements for the Auburn Meadows and Beaver Creek subdivision changed the recommended 16-inch transmission main on New Michigan Road to parallel 12-inch mains; one on New Michigan Road and one through the subdivisions.
2. Improvements in the City of Canandaigua water system that unintentionally locked the Brickyard Tank, and the City's North Road tank, out of the system.
3. Changes in development trends in the Town of Canandaigua that preclude construction of a 16-inch transmission main along Yerkes Road and New Michigan Road in the Town of Canandaigua.

C. CONDITION OF EXISTING FACILITIES

In general the water system is well maintained and in good condition consistent with the age of the infrastructure. CFWD routinely repairs water main breaks as they occur in the system. It was noted that the existing water main on Brickyard Road is in poor condition having been repaired several times of the past few years.

CFWD is gravity fed from the City of Canandaigua. The capacity of the distribution system is a function of water level in the City reservoirs, system demands and condition of water mains. Prior analysis of the system determined that in general the condition of the mains is consistent with their age and material of construction. Older cast iron pipes appear to offer some resistance to flow due to sedimentation and scale in the pipes. Newer PVC and older transite (asbestos cement) tend to resist scale and have better flow characteristics.

1. Peaking Factors

A report, *Hydraulic Modeling of the City of Canandaigua Water Distribution System (City Study)*, prepared for the City of Canandaigua Department of Public Works (MRB Group, 2012), reviewed water supply data for the City of Canandaigua Water Treatment Plant and determined that average day demand of the entire service area, which includes the Canandaigua Farmington Water District, was approximately 3.87 MGD with a maximum day demand of 6.31 MGD. Table 4 summarizes the water supply data and demand factors from the 2012 *City Study*. Peak hour demand is based on daily changes in system pressure measured by a data logger in August 2015.

Table 4 - Peaking Factors

DEMAND	FLOW	FACTOR
Average Day	3.87 MGD	1.0
Maximum Day	6.31 MGD	1.63
Peak Hour	6.530 gpm	2.43

2. Daily Demand Pattern

A data logger was placed on a hydrant on Brickyard Road by the service driveway to the Brickyard Road tank and was utilized to collect pressure data from August 17, 2015 to August 25, 2015. The intent of the data logging effort was to verify the hydraulic grade at the tank. The data logger was programmed to record system data every 10-seconds in five minute intervals. At the end each interval the minimum and maximum values are stored as well as the average of the five minute interval.

The data logger was also placed on a hydrant on North Road, just east of Brickyard Road from August 25, 2015 to September 4, 2015. Data from the second location provided information about system pressures on the City of Canandaigua side of the supply to the CFWD.

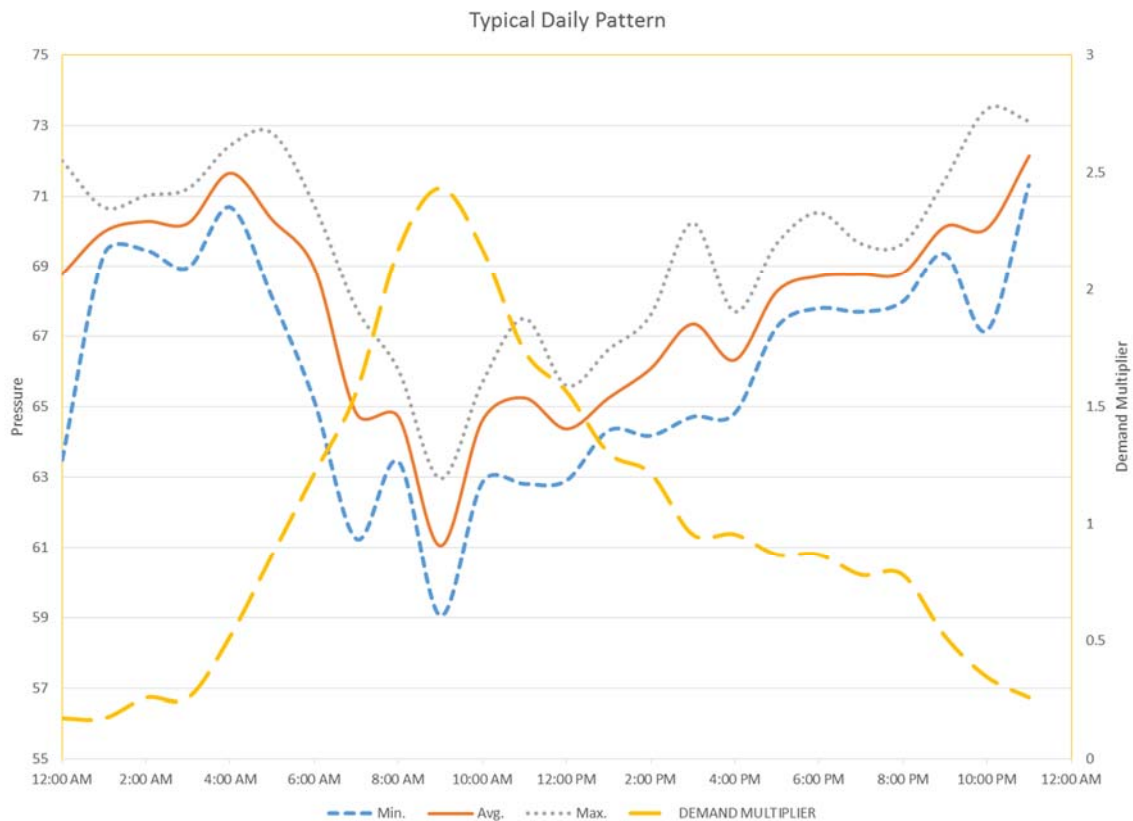

The data collected showed that the system pressures, and resultant hydraulic grade, normally lock the Brickyard Road tank out of the system with the exception of peak hour and fire demands.

Review of the Brickyard Road data showed that system pressure at the tank ranged from 32 psi to 77 psi with an average pressure of 66 psi. Closer review of the data, and conversations with the water system operators for both the CFWD and City of Canandaigua, revealed that a local industry tests its fire pumps on a weekly basis. The 32 psi pressure at the tank occurred during one such test and is more representative of a fire demand than an actual, daily demand. Low system pressure, discounting the pump test pressures, is approximately 53 psi.

Review of the North Road data found that pressures ranged from 19 psi to 83 psi with an average of 71 psi. Closer review of the data found that the more typical system low pressure is 60 psi. The low observed pressure of 19 psi occurred during an extended fire pump test at the local industry.

Pressure data collected by the data logger was utilized to adjust system demands in a hydraulic model of the system so model results more closely approximate system performance.

The data shows that, in general, water demand increases from mid-night to 9:00 AM with peak demands typically between 8:00 AM and 10:00 AM. After 10:00 AM demand slowly decreases to minimum levels during the middle of the night. Minimum demands are approximately 20% of the average day demand, and peak hour is 2.43 times greater than average day demands.

Model results also found that a demand of approximately 7,000 gpm was needed at the facility testing its fire pumps in order to approximate the low system pressures observed during the fire pump tests. The industry's fire pump tests are significant in two ways. The first is that the tests demonstrate actual system performance during a fire, and the second is that the tests occur on a routine enough basis that they need to be considered while reviewing options to improve overall system performance and the operation of the Brickyard Road tank.

3. Anticipated System Pressures

The estimated peaking factors shown in Table 4 and the daily use pattern observed by the data logger were applied to the hydraulic model of the system. Model results determined that during average day demand that pressures at the tank can fluctuate by approximately 25 psi. The fluctuation increases to 38 psi during maximum day demand.

The data logging effort and model results also showed during the fire pump tests that the pressure at the tank drops by approximately 42 psi during average day demand; 50 psi during maximum day demand. This change in pressure not only affected the area around the industry and the tank, but the entire CFWD service area including Zones 2 and 3. These pressure swings, with and without the fire pumps operating, are greater than recommended by the Department of Health. The Department of Health recommends that the maximum variation in tank level be 30-feet, which equates to a 13 psi change in system pressure.

The high point in the CFWD is near the intersection of North Road and East Street (elevation 828. Model results indicate that during maximum day demands that pressures at this location may be as low as 30 psi. During the fire pump tests pressures may drop to 18 psi during average day demand and 7 psi during max day demand. These pressures are significantly less than the minimum system pressure of 35 psi required by the Department of Health.

Table 5 represents pressures and anticipated fire flows at select points within each Zone under existing average day demands. Fire flows in Zone 3 that are less than 600 gpm are located in the eastern portion of the Town of Manchester and are included to demonstrate hydraulic characteristics in the entire service area north of the City of Canandaigua. Listed fire flow is the flow available at the hydrant at a minimum *system* pressure of 20 psi, under average day demand. Actual system pressures and fire flows may be lower during maximum day and peak hour demands.

4. Water Age

The existing tank is connected to the distribution system through a single pipe and does not include mixing. A single pipe connection causes the last water to enter a tank to be the first water withdrawn from a tank. Single pipe connections are also known to cause stratification in a tank with older water being held in the upper levels of the tank. Currently the Brickyard Road tank is normally locked out of the system during average day demands and only contributes during peak hour and fire demands. Model results indicate that the typical water age in the tank varies during average day demand and can be in excess of 1,000 hours old. The only time fresh water is introduced into the tank is when it refills after peak hour or fire flow demands. Table 6 shows

typical water age at select points in the distribution system. (Locations are the same as those listed in Table 5.)

5. 2002 Master Plan

The 2002 Master Plan, *New Michigan/Yerkes Road Transmission Main* improvements included a new 16-inch diameter transmission main from the intersection of Brickyard Road and Yerkes Road to New Michigan Road, then north along New Michigan Road to connect to County Road 41. This new transmission main would also connect to an existing water main on CFTL Road with 12-inch diameter pipe. In addition, this improvement included a replacement 10-inch water main on Brickyard Road with 16-inch diameter water main between Yerkes Road and the tank.

A pressure reducing valve was proposed on the connection to the existing water main on CFTL Road as well as the connection to County Road 41. Also included was a new 12-inch diameter water main along McIntyre Road from Yerkes Road to County Road 30 that connects to an existing 8" water main on County Road 30. An additional pressure-sustaining/reducing valve, located on McIntyre Road, was proposed to maintain the existing system pressures in the Town of Canandaigua Water District and provide supplemental water to CFWD during high demands.

The *New Michigan/Yerkes Road Transmission Main* connected Zone 1 to Zone 3 through a proposed transmission main on New Michigan Road. It also connected to Zone 2 through the 12-inch main on CFTL Road. Hydraulic modeling showed that the proposed project improved system performance in both Zone 2 and Zone 3.

Conditions have changed since the 2002 Master Plan including the construction of a 24-inch transmission main in the City of Canandaigua along North Pearl Street and North Street. This large diameter transmission main overcame hydraulic restrictions that previously existed in the City distribution system but had the unintended result of locking out both the City of Canandaigua North Main Street Tank and the CFWD Brickyard Road tank from the system.

Other changes since the Master Plan include reducing the size of the proposed transmission main on New Michigan Road from 16-inch to 12-inch and allowing a developer to run a 12-inch transmission main through the Auburn Meadows and Beaver Creek Subdivisions. This change was allowed under an incentive zoning agreement. Modeling of the system determined that when the New Michigan Road water main is complete, that the parallel 12-inch mains provide similar hydraulic benefit to Zones 2 and 3 as the 16-inch transmission main recommended in the 2002 Master Plan.

Figure 4 is an updated version of the 2002 Master Plan *New Michigan/Yerkes Road Transmission Main* improvement that includes the parallel 12-inch mains. Included are future developments (approved as of the writing of this report) in the study area and a PRV at the intersection of New Michigan Road and CFTL Road. This valve is needed to reduce pressure in Auburn Meadows and Beaver Creek to acceptable levels. Addition of this valve creates a new hydraulic grade zone, Zone 2A, that operates at a higher grade than Zone 2 in order to produce acceptable pressures in the zone.

Table 7 represents anticipated average day pressures and fire flow based on the 2002 Master Plan *New Michigan/Yerkes Road Transmission Main* as modified and shown in Figure 4. These results are included to show the anticipated benefit of the recommended improvements when compared to existing conditions and to serve as a baseline for evaluating various alternatives considered in this study.

D. FINANCIAL STATUS OF EXISTING FACILITIES

2015 financial data for the CFWD is included in Appendix E. The financial data includes a breakdown of income, annual O&M costs, debt repayments, reserves and budgeted capital projects for 2016. Included with the data is the rate schedule for water.

1. Income: CFWD income is based on a minimum bill plus a rate per thousand gallons of water used. The rate per thousand is based on meter size. The water revenue for 2015 was \$2,679,026.00.
2. Annual O&M Cost: The financial data includes operation and maintenance expenses of \$609,810.00 which includes fuel and District improvements.
3. Reserve: CFWD has a capital reserve fund of \$746,048.62.
4. Debt Repayment: Outstanding debt for the District is \$585,256.00 which is for repayment of eight bonds.

E. WATER/ENERGY/WASTE AUDITS

CFWD issues an annual water quality report in accordance with NYSDOH regulations. According to the 2015 report, CFWD purchased 646.2 million gallons of water and delivered 501.5 million gallons to its customers resulting in 144.7 million gallons of unaccounted water. Table 8 summarizes the water use and loss data from the 2015 Annual Water Quality Report.

Table 8 - Water Loss

	Qty (gal)	% of Purchased
Purchased	646,176,000	
Customers	501,458,000	77.6%
Sub-Total - Unaccounted	144,718,000	
Estimated Loss		
Flushing and Fire Protection	44,862,580	6.9%
Water Main Leaks	17,366,160	2.7%
Hydrant Meter Rentals	1,427,000	0.2%
Sub-Total - Estimated Loss	63,655,740	9.9%
Unaccountable Water	81,062,260	12.5%

III. NEED FOR PROJECT

A. HEALTH, SANITATION, AND SECURITY

Hydraulic review of planned developments along SR 332 identified transmission improvements along Brickyard Road needed to supply ISO recommended fire flows. These improvements may include replacing existing water main or providing additional points of connection (or looping) in the water system. Potential improvements include increasing the size of the transmission main from Yerkes Road to the Brickyard Road tank, increasing the capacity of the water main on Route 332, providing an interconnection to Route 332 through the Auburn Meadows / Beaver Creek sub-divisions, or improving the capacity of the water main on CR 41 and providing a connection to the development that allows flow during fire demands.

System improvements in the City of Canandaigua over the past several years have improved the transmission capacity of the City water lines. However these improvements have effectively locked the Brickyard Road tank out of the water system. Locking the tank out of the system prevents it from equalizing system pressures and produces aged water. This old water is drawn into the system on a weekly basis during fire pump tests conducted by a local industry and potentially during peak hour demands. The old water results in lowered system water quality and increased potential for disinfection byproduct formation.

Extended pressure readings taken in the system found that routine fire pump testing by a large industrial user decreases system pressure to below Department of Health guidance for short durations (1-hour +/-) on a weekly basis. Certain fire pump tests at the facility result in system pressures at or below 20 psi for the duration of the test. Anecdotally, CFWD reported instances of extended low pressure during the fire pump tests that caused a local car wash to shutdown, trapping cars inside for over an hour. Upgrading the tank is necessary to equalize system pressure and provide needed storage during fire demands. It is anticipated that upgrading the tank will equalize system pressures so minimum pressures are above 35 psi during the industrial fire pump tests. The increase in system pressures reduces the potential of contaminants being introduced into the system by preventing the potential for backflow from un-protected industrial and commercial users.

B. AGING INFRASTRUCTURE

The water main on Brickyard Road was installed when the tank was constructed in the 1960's. The water main is in poor condition needing frequent repairs; it has reached the end of its useful life. Its replacement and upgrade is necessary for proper system operation.

Table 8 shows water loss in the distribution system due to water main leaks and unaccountable water. Improvements to the Brickyard Road water main will help reduce the amount of water loss.

A recent inspection (2015) of the Brickyard Road tank found that it is in fair condition with localized areas of heavy corrosion. The inspection recommended replacement or repair of the tank. The tank was originally built in the 1960 and has been re-coated twice; the tank is nearing the end of its useful life.

C. REASONABLE GROWTH

Table 1 summarizes growth in the system and shows that from 1970 to 2015 that the population in Farmington alone has grown by a factor of over 3.6x. The Brickyard Road tank was likely sized for a 30-year planning period so is past its design life. Based on the population projection listed in Table 3 it is anticipated that the population served in the existing service area may increase at least 34% by 2040.

IV. ALTERNATIVES CONSIDERED

A. TRANSMISSION MAIN ALTERNATIVES

Anticipated development in the Town of Canandaigua, south of CFTL Road and west of Route 332 has changed since the 2002 Master Plan. Over the past few years Town of Canandaigua has received applications from several land owners in the Padelford Brook Greenway area (Figure 3) for the purchase of development rights (PDR Applications) and anticipates receiving additional applications over the next few years. Once the applications are approved, the affected lands can only be used for agriculture or open space. No future development is allowed without repeal of the application by the Town of Canandaigua Board.

Town of Canandaigua therefore has decided not to allow a 16-inch transmission main along Yerkes Road and New Michigan Road in the Town of Canandaigua as called for in the 2002 Master Plan. This decision is also based on concerns that the transmission main may encourage

development in the Padelford Brook Greenway area, have a negative impact on Agricultural District ONTA001, may be near an archeologically sensitive area, may be within wetland check zones, and will likely involve creek crossings.

For the sake of comparison, the probable project cost for the *New Michigan/Yerkes Road Transmission Main* improvements as contemplated in the 2002 Master Plan, including repairs to the existing tank, is approximately \$5,790,000 (2015 cost).

Three alternatives were considered for re-routing the 16-inch transmission main away from Yerkes Road and New Michigan Road. Each transmission alternative includes a PRV vault at the point of connection on CFTL Road to provide reasonable pressure in the Auburn Meadows and Beaver Creek subdivisions while still providing a hydraulic benefit to Zone 3. This new PRV, in conjunction with the already planned PRV on CFTL Road and the PRV on New Michigan Road create a new hydraulic grade zone; Zone 2A. Without the PRV, pressures in the subdivisions would range from 100 psi to 124 psi; with the PRV pressures range from 55 psi to 85 psi depending on final PRV setting.

Each alternative assumes that the 12-inch main on New Michigan Road in the Town of Farmington, the 12-inch main on CFTL Road, a PRV on CFTL Road near Spartan Drive, and the combination pressure reducing/sustaining valve on New Michigan Road at County Road 41 will be built under existing incentive zoning agreements for the Auburn Meadows and Beaver Creek developments. No costs for the incentive zoning based improvements are therefore included in this Study. The new PRV that connects to the new Zone 2A is included in the cost for the Brickyard Road transmission main. Since the flow on CFTL Road is from Zone 2A to Zone 2, the previously proposed PRV at this location should be a combination pressure reducing/sustaining valve in order to maintain system pressure in Zone 2A during high demands.

1. Transmission Alternative 1

The first alternative considered two options for running a 16-inch transmission main along either the southern and western borders of parcel 55.00-1-4.000 (6031-6055 Canandaigua Farmington Town Line Road) or along its eastern lot line. The transmission main would run along Brickyard Road from Yerkes Road north to parcel 55.00-1-4.000. The first route would connect to the 12-inch main at the intersection of New Michigan Road and CFTL Road. The route along the eastern property line would connect to CFTL Road in the general area of Stablegate Drive. This second route would also include a parallel 12-inch main along CFTL Road from the point of connection

to Spartan Drive. The parallel line is needed to provide the same capacity as the 16-inch transmission main to the area of Beaver Creek and Auburn Meadows.

The disadvantage of Alternative 1 is that it creates a concern that the transmission main may encourage development of Parcel 55.00-1-4.000, which has been identified by the Town of Canandaigua as potential open space and is included in the Padelford Brook Greenway. Due to this, Alternative 1 was not considered a viable alternative.

2. Transmission Alternative 2

Alternative 2 contemplated connecting the 16-inch transmission main to the 8-inch main in the Stablegate subdivision. This alternative also needed a PRV east of Stablegate and a parallel, 12-inch main along CFTL Road to derive similar benefit to Zones 2 and 3 as anticipated in the 2002 Master Plan. This alternative was not further considered due to the need for easements in the Stablegate subdivision and limited access between buildings within the subdivision.

3. Transmission Alternative 3

Alternative 3 consists of a 16-inch transmission main along Brickyard Road from Yerkes Road to the Stablegate subdivision where it would head north along the east side of the deployment following the Auburn Trail to CFTL Road. It would then run west to the general vicinity of Spartan Drive. A vault with two PRVs would be located at Maplewood Drive. The first would be a pressure reducing/sustaining valve that controls pressure entering Zone 2, the second would reduce pressure to the West, into Zone 2A. Both valves will allow flow in the opposite direction on reversal of hydraulic grade and will put the Stablegate subdivision in the new hydraulic grade Zone 2A. This route utilizes existing easements and rights-of-way and has a low probability of attracting development along its route. The route is shown on Figure 2.

Consideration was also given to a 12-inch transmission main instead of the proposed 16-inch. Hydraulic analysis of the 12-inch line however, determined that utilizing a 12-inch pipe does not provide the same hydraulic benefit as the proposed 16-inch pipe. A 16-inch pipe is necessary to provide the same hydraulic benefit to the service area as called for in the 2002 Master Plan.

B. BRICKYARD ROAD TANK ALTERNATIVES

The Brickyard tank is normally locked out of the system; only contributing flow during peak hour demands and during fire demands. Four alternatives were considered to address the Brickyard Road tank:

1. eliminate the tank;
2. replace the existing tank with a 24-inch transmission main;
3. rehabilitate the tank; and,
4. replace the tank with elevated storage.

1. Eliminate Tank

Eliminating the tank was considered since the existing tank is normally locked out of the system. Hydraulic analysis of the system found that pressures on Brickyard Road at the tank would range from 75 psi to as low as 5 psi during peak hour demand and while the industrial user tests its fire pumps. Pressures at the high point in the system are less than -2.7 psi. Without the tank to buffer the system, a large fire demand could create negative pressure in the system. Review of this option determined that a tank is needed to help buffer system pressures during high demands.

2. Replace Tank with 24-inch Transmission Main

Replacing the tank with a 24-inch transmission main was given consideration as a means of extending the hydraulic grade from the City of Canandaigua limits further into the CFWD. Analysis of this alternative showed an improvement in system performance compared to the no tank alternative, but it did not address system pressures. The larger transmission main resulted in pressures on Brickyard Road that range from 23 psi to 75 psi. The minimum system pressure on North Street would be 7.6 psi. These pressures are below DOH minimums so this alternative cannot be considered further.

3. Rehabilitate Existing Tank

Three options were considered to rehabilitate the existing tank:

- a. rehabilitate the tank only;
- b. add a pump to drain the tank; and,
- c. construct a dedicated transmission main.

a. Rehabilitate Tank Only

The first option is to repair, recoat and continue utilizing the Brickyard Road Tank without further modification to the system. This alternative however, does not improve the operation of the tank since it would still normally be locked out of the system so it was not further considered.

b. Add a Pump Station

This option contemplated a pump station that draws water from the existing tank and pumps directly back into Zone 1. A control valve with pressure sustaining features would be needed to control the rate of flow into the tank and maintain Zone 1 pressures while the tank fills. Modifications are also needed at the connection on Brickyard Road to prevent water pumped from the tank from flowing back into the tank during the fill cycle. This option also provides the ability to add a high flow pump that can essentially utilize the entire tank volume to supplement fire flow in the distribution system. Under normal conditions the pump would operate on a timer to drain the tank.

The disadvantage is that the system relies on a complex control system for pump and fill valve operation. It also relies on pumping to move water in order to keep it fresh. Further, similar systems installed in neighboring communities have met with limited success and were eventually abandoned. For these reasons, pumping was not further considered.

c. Dedicated Transmission Main

Under this option the proposed transmission main would connect the existing tank tank directly to Zone 2A (Transmission Alternative 3) with the hydraulic grade in Zone 2A controlled by the level of the tank. The dedicated transmission main would induce flow through the tank and help promote mixing. A control valve that operates based on tank level would control flow rate into the tank to prevent wide pressure swings in Zone 1 when the tank fills. This option also includes system modifications needed to allow the tank to feed Zone 1 during peak hour and high fire flow demands.

The advantage of this option is that the dedicated transmission main puts the tank back into service.

The disadvantage is that the tank primarily benefits Zone 2A with the hydraulic grade in the zone controlled by tank level. Fire demands in Zone 1 that draw from the tank can potentially cause lower pressures in Zone 2A when the tank is at lower than normal levels. This alternative also requires the existing water main on Brickyard Road to stay in service in order to keep the users along the Road in Zone 1. Transferring the services to the transmission main is not recommended since the users would then be on the lower, Zone 2A, hydraulic grade zone, which would result in lower than required service pressures along the Road, particularly near the tank. The 2002 Master Plan called for the existing water main on Brickyard Road to be replaced, which would be an additional cost to the project.

An additional disadvantage is that the tank has already been re-coated two times and is nearing the end of its useful service life. An inspection of the tank interior performed on July 29, 2015 found that the interior was in fair condition with a few areas in poor condition. The floor and exterior were in good condition. Several interior areas have heavy staining and corrosion, and holes were observed in the cover. It is likely the holes in the cover were utilized to support scaffolding the last time the tank was painted. Normally these holes are plugged after the tank is painted so it is not clear if the holes were left unplugged or if the plugs came out over the past several years. The tank will require repair and recoating to keep it in service.

Table 9 provides the anticipated pressures and fire flows at select points in the system during average day demands. Anticipated flows are less than those expected by the 2002 Master Plan improvements (see Table 7). The probable project cost for this alternative including a tank mixing system, is \$3,235,000. Figure 2 shows the proposed route of the transmission main.

4. Elevated Storage Tank

The final alternative is to replace the existing tank with a new, elevated tank. Advantages to this alternative include:

1. Tank level floats on the system.
2. The tank will act as a buffer, minimizing pressure swings during normal operation and fire demands.

Table 9 – Existing Tank with Dedicated Transmission Main

C. DESIGN CRITERIA

Evaluation of a new storage tank was based on an ideal tank of sufficient height to cover the anticipated hydraulic grade range (change in system pressure) of the distribution system when the tank is online. Hydraulic analysis was utilized on an iterative basis to determine a tank diameter

needed to provide the desired hydraulic grade range. The ideal tank utilized in the evaluation was 96-ft diameter, 200-ft tall and with a base elevation equal to the existing tank (elevation 804).

Two goals of the evaluation were to provide a tank that improves system performance and improves water quality in the tank. One method to improve quality is to force flow through the tank causing active mixing of the contents. In order to do this, it is proposed to utilize the transmission main as a dedicated line to Zone 2A from the tank. It was also noted during the hydraulic review that the control valves between the different zones need to be adjusted so the preferred flow path to Zones 2 and 2A is through the tank.

1. Tank Volume Guidance

There are several guidance documents available to estimate the needed storage volume in a distribution system including:

1. U.S. Fire Administration Water Supply Systems and Evaluation Method (FEMA, October 2008).
2. Recommended Standards for Water Works.
3. ISO's Fire Suppression Rating Schedule.

The following is a comparison of the different methods for determining the suggested, minimum storage requirements for the Brickyard Road tank.

a. U.S. Fire Administration Water Supply System and Evaluation Method

One document, *U.S. Fire Administration Water Supply Systems and Evaluation Method* (FEMA, October 2008) discusses utilizing hourly system demand curves to determine cumulative changes in system storage volume. The FEMA document states that for moderate systems the amount of storage available to equalize production is 30% to 40% of the total storage available for pressure equalization and emergency water reserves. The FEMA document is also included in AWWA Manual of Practice M31, *Distribution System Requirements for Fire Protection*.

Since the existing tank is normally locked out of the system, the hydraulic model was utilized to determine the daily change in tank volume for an ideal tank under average day demands and maximum day demands. Model results showed that the average day change in storage was 524,000 gallons; 981,000 for maximum day. Table 11 lists the estimated storage volume based on the U.S. Fire Administration Method.

Table 11 - U.S. Fire Administration Method

	Avg. Day	Max Day
Volume Change	524,000 gal	981,000 gal
30% Volume	1,747,000 gal	3,270,000 gal
40% Volume	1,310,000 gal	2,453,000 gal

b. Recommended Standards for Water Works

The Recommended Standards for Water Works provides guidance for sizing a water storage tank in a distribution system based on type of system. For systems that *do not* provide fire protection, the minimum storage is the average day system demand. For systems that provide fire protection (such as the CFWD), the Standards state that storage should satisfy ISO fire flow requirements. The volume needed to satisfy the total existing average day demand is approximately 758,000 gallons. This volume is based on estimated water use in Zones 1 and 2 of the existing CFWD.

Under normal operating conditions, water is supplied to the CFWD by the City of Canandaigua from its reservoirs, west of its water treatment plant. Flow into the District is through metered connections off a City water main that runs along North Street. The meters are located at Brickyard Road, north of Midlakes Drive, and at Route 332 (North Main Street). Flow at each point of connection is measured through a magnetic flow meter. Each meter vault also contains a check valve that prevents flow back into the City's distribution system.

Table 12 – Recommended Standards Average Day Method

Volume
Average Day Demand 758,000 gal

c. ISO's Fire Suppression Rating Schedule

ISO's Fire Suppression Rating Schedule (ISO, 2013), section 611,A. provides guidance for determining the credit given for minimum storage maintained, which is the storage volume needed for fire protection. Credit given for storage is one component used to determine a fire protection area's fire protection rating. The criteria used to determine the credit for storage as a source of supply includes the following:

- Credit no more than average daily minimum storage maintained.
- For storage floating on the distribution system credit only the portion of average daily minimum storage that the system can deliver at the required residual pressure and for the fire

duration at the point of use. Minimum storage is the sum of all storages available at the test location for the fire duration, expressed in gallons per minute (gpm).

- For storage where the average daily minimum storage must be re-pumped, limit credit to the capacity of the pumping facility for the fire duration.
- When a fire protection area experiences large seasonal fluctuations of population, evaluate the average daily minimum storage at the time when consumption is average for the maximum population.

ISO defines minimum storage maintained (MSM) as the volume in a storage tank or reservoir between its low operating level and the level needed to maintain 20 psi in the associated fire protection area. A fire protection area is an area bounded by pumped sources of supply and control valves that are either sources of supply or used to supply an adjacent protection area. For purposes of this review the check valves in the meter vaults at the City of Canandaigua limits are considered the boundary of the supply area for the Brickyard tank.

ISO needed fire flow for a protection area range from 500 gpm to 12,000 gpm with a maximum of 3,500 gpm for habitable buildings. ISO does not consider needed fire flows greater than 3,500 gpm when determining a protection area classification. The duration for a needed fire flow of 3,500 gpm is three (3) hours.

In order for CFWD Zones 1 and 2 to receive full storage credit for fire suppression, the minimum storage maintained needs to be 725,000 gallons based on average day demand and 785,000 gallons based on maximum day demand. These volumes are based on all the flow being provided from the Brickyard Road tank. Since these volumes are between the low operation level of the tank and the level needed to maintain 20 psi in the distribution system, they are in addition to the volume needed for daily changes in tank level.

Table 13 - ISO Minimum Storage Maintained

3-Hour Demand	Average Day	Maximum Day
3,500 gpm Fire Flow	630,000 gal	630,000 gal
Daily	95,000 gal	155,000 gal
Total Volume	725,000 gal	785,000 gal

Based on ISO guidelines, the MSM in the system can be reduced by sources of supply such as interconnections to adjacent water systems.

The estimated fire pump test rate by the industrial user is 6,970 gpm. This flow rate is the amount needed for the hydraulic model to approximate the measured system pressures observed during the data logging effort. Review of the model determined that during the pump tests that approximately 6,200 gpm came from the City during average day demands; 4,500 gpm was supplied during maximum day demand. Based on ISO guidelines, the minimum storage maintained can be reduced by the flow rate from the City for the duration of the fire. The minimum storage maintained with reliance on flow from the City needed to receive full credit is shown in Table 14. The volumes shown are less than zero (0) indicating that there is sufficient supply capacity from the City to satisfy the ISO minimum storage maintained criteria for the community.

Table 14 - ISO Minimum Storage Maintained with City

3-Hour Demand	Average Day	Maximum Day
3,500 gpm Fire Flow	630,000 gal	630,000 gal
Daily Demand	95,000 gal	155,000 gal
Volume w/o City	725,000 gal	785,000 gal
City Supply	-1,132,000 gal	-857,000 gal
Total Volume	-407,000 gal	-72,000 gal

Volumes shown in Table 13 and Table 14 are based on a maximum fire demand for a community of 3,500 gpm. In reviewing an individual facility, ISO gives full credit to a facility if it can satisfy the needed facility flow with other sources of supply such as on site storage. Based on ISO guidance, needed fire flows over 4,500 gpm have a duration of 4-hours. It can be assumed that the estimated pump test rate by the industrial user of 6,970 gpm represents the needed fire flow for the facility. Table 15 summarizes the estimated needed minimum storage maintained based on the needed fire flow for the facility being provided from the Brickyard Road tank and the City of Canandaigua connections. It should be noted that the industry in question does have an on-site fire storage tank of unknown volume. It is apparent based on the data logging effort that the tank was either offline during the tests or that it does not have enough storage to supply the entire needed fire flow for the facility. If the tank were online or had sufficient storage, the impact on system pressure during the pump tests in the CFWD and City of Canandaigua would be less.

Table 15 - ISO Facility Minimum Storage Maintained

4-Hour Demand	Average Day	Maximum Day
6,970 gpm Fire Flow	1,673,000 gal	1,673,000 gal
Daily Demand	126,000 gal	206,000 gal
Volume w/o City	1,799,000 gal	1,879,000 gal
City Supply	-1,509,000 gal	-1,143,000 gal
Total Volume	290,000 gal	736,000 gal

The ISO method for determining the minimum storage maintained needed to receive full credit for storage results in two volumes depending on if the tank is considered a source of supply during a fire for the community or if it is a source of supply for the community plus the large industry. A 3,500 gpm community fire demand can be supplied through the City of Canandaigua connections without reliance on the Brickyard tank. An industrial fire demand of 6,970 gpm, however, does rely on storage in the Brickyard tank to meet needed flow.

2. Tank Size

The FEMA method provides storage volumes needed for pressure equalization and emergency water reserves, the Recommended Standards method provides guidance for systems that do not provide fire protection, and the ISO method provides means for determining the credit a community will receive for fire flow available from storage for a needed duration as part of its overall community rating. The ISO method is only for storage below the normal low operating level of a tank, it does not give guidance for the total volume needed in a tank for pressure equalization and emergency water reserves.

The most encompassing method is the FEMA method since it includes both pressure equalization and emergency storage. The FEMA method, however, provides a broad size ranging from 1.3 million gallons to 3.3 million gallons.

Hydraulic modeling was utilized to estimate a tank size that provides system pressure equalization, emergency storage, and minimizes excess storage as called for in the *Recommended Standards for Water Works*.

Section 7.0.1.b of the *Recommended Standards* states that “excessive storage capacity should be avoided to prevent potential water quality deterioration problems.” Section 7.0.6 goes on to say

that “finished water storage designed to facilitate fire flow requirements and meet average daily consumption should be designed to facilitate turnover of water in the finished water storage to minimize stagnation and/or stored water age.” Section 7.3.1 provides guidance regarding the maximum variation in tank level by stating “the maximum variation between high and low levels in storage structures providing pressure to a distribution system should not exceed 30 feet.”

The hydraulic model was utilized to estimate the change in volume of the ideal tank based on average day demands and maximum day demands (see Table 11). The model was then modified so the tank represented three potential tank sizes: 650,000 gallons, 1.25 million gallons and 2.03 million gallons. The sizes were selected based on the range estimated by the various methods. The model was then run to estimate the long term performance of the tank based on average day demands, maximum day demands and an extended period of high demand (maximum day demands for a week). The simulations included the weekly fire pump tests by the industry since this is a known condition in the system.

Model results of the 650,000 gallon tank found that it drained completely after 9.5 hours during maximum day demands. Since the tank cannot supply water during maximum day demand, this size cannot be recommended.

A 1.25 million gallon tank was able to supply water during the maximum day demand with the tank starting to refill toward the end of the day. However, the results showed that by the end of the day that the tank had not refilled to its initial level. During extend maximum demands (one week drought), the tank drained after 35-hours. Because of this, a 1.25 million gallon tank cannot be recommended.

Utilizing a 2.03 million gallon tank provided the most favorable model results. During average day demands the hydraulic grade in the tank ranged from elevation 954 to 965. During prolonged maximum day demands (one week) the tank level was lower, ranging from elevation 931 to 949. The overall range in tank level is approximately 35-feet which may occur during peak hour, during extended period of maximum day demands, and while the industry is testing its pumps. Normal operating ranges are typically within the 30-foot limit in the *Recommended Standards*.

The upper elevation of 965 is 7-feet lower than the normal water level in the City reservoirs. A change in hydraulic grade is expected between the reservoirs and the tank due to system demands, pipe losses, and losses through the meter vaults. The proposed tank would have an overflow

elevation of 966 to provide freeboard above the anticipated normal high water level. An altitude valve would be provided on the tank fill line to prevent the tank from overflowing in the unlikely event that system demand drops low enough for the grade at the tank to match that of the City reservoirs.

In order to facilitate turnover in the tank it is recommended that the discharge line from the tank be connected directly to the transmission main to Zone 2A. It will also be necessary to adjust the PRVs on Route 332 and County Road 8 so that the preferred flow path is through the tank.

Under normal operation, flow would be into the tank through a dedicated line that includes an altitude valve and inlet check valve. A PRV would also be provided on the inlet that allows flow into Zone 1 during peak hour and fire demands. Flow from the tank would be through a dedicated line that connects to the transmission main. The discharge line would include a check valve to prevent flow into the tank.

The proposed tank provides sufficient storage for average day demands plus fire demands up to 6,200 gpm for 3-hours; which includes 4,760 gpm from the City of Canandaigua. Without adding additional volume, the tank would not support a prolonged, higher flow 4-hour fire demand that may be required by local industry.

3. Tank Mixing

Tank mixing eliminates tank stratification and helps improve water quality. Mixing can be provided by either active or passive systems. An active mixing system utilizes a mechanical device to physically stir the tank and operates independent of flow through the tank. Passive mixing systems rely on flow through the tank. Both types of mixing systems rely on the tank being online, meaning that there needs to be flow into, and out of the tank. An active mixing system reduces tank stratification but, without flow through the tank, the water remains stagnant and its quality steadily decreases. A passive system only works if there is flow.

Since the Brickyard Road tank is now locked out of the system, a mixing system alone will not improve the water quality in the tank since there is no flow through the tank. Adding a mixing system alone is not recommended.

The Alternatives considered include distribution system improvements designed to induce flow through the Brickyard Road tank and to prevent water drawn from the tank from flowing back into the tank during a fill cycle as a means of keeping the tank water fresh. A mixing system is recommended as part of each alternative due to the potential water quality improvements.

4. Water Age

Section 7.0.6 of the *Recommended* Standards states that “finished water storage designed to facilitate fire flow requirements and meet average daily consumption should be designed to facilitate turnover of water in the finished water storage to minimize stagnation and/or stored water age.” Modifying the tank so flow is through the tank reduces water age in the tank and in the distribution system and is shown in Table 16. Tank water age is expected to be from 70 hours to 80 hours old. The significant reduction in water age from existing conditions is due to flow through the tank and the addition of a mixing system.

D. ENVIRONMENTAL IMPACTS

Environmental resources present are discussed in Section I.B. Impacts on the resources will be minimal since the project follows Brickyard Road and along the eastern property line of an existing development, following the Auburn Trail. Work within the wetlands will be inside the existing right of way. Restoration will return the surface to existing conditions.

No hydrants will be located in the flood hazard area to protect the water supply during a flood event.

The route of the water main was chosen to reduce the potential impact of public water on agricultural land. The transmission main follows an existing water main.

E. LAND REQUIREMENTS

Most of the transmission main is located in the existing right-of way for Brickyard Road. The portion between Purdy Road and CFTL Road will follow existing lot lines and the Auburn Trail and require a utility easement.

The new water tank will be located on the same site as the existing tank to requiring no additional land.

Table 16 - Anticipated Water Age

F. POTENTIAL CONSTRUCTION PROBLEMS

Utility coordination will be required along Brickyard Road to avoid conflicts with other utilities such as gas and electric. Final location of the water transmission main and replacement water main will be coordinated with the other utilities.

Construction within the wetland, and along the length of the project, will be in accordance with NYSDEC storm water pollution prevention requirements. It is anticipated that the water installed through the wetland and floor hazard zone will be directionally drilled to mitigate impacts to the surface.

Coordination will be needed with the FAA and Ontario County IDA for illuminating the elevated tank. The tank site is approximately one-mile from the north end of the Canandaigua Airport's runway.

G. SUSTAINABILITY CONSIDERATIONS

1. Water and Energy Efficiency – The intent of the project is to improve water transmission efficiency of the distribution system needed to provide pressure equalization, improve fire flow and provide usable system storage. The system is gravity fed so does not increase energy demands.
2. Green Infrastructure – The project does not change existing storm water runoff since it utilizes below grade infrastructure. Surface restoration after construction will return surface drainage patterns to pre-construction conditions.

H. PROBABLE COSTS

1. Rehabilitate Existing Tank

The probable cost to rehabilitate the existing tank, add a mixing system and construct a dedicated transmission main that connects the tank to hydraulic grade Zone 2 is approximately \$3,235,000.

Table 17 - Rehabilitate Existing Tank

ITEM	COST
16-inch Transmission Main	\$ 1,446,000
Repair Existing Tank.	\$ 755,000
Tank Mixing	\$ 109,000
Probable Construction Cost	\$ 2,310,000
Construction Contingency	\$ 347,000
Engineering, Legal, Administrative	\$ 578,000
Total Project Budget	\$ 3,235,000

2. Replace Tank

The probable cost to replace the existing tank, include a mixing system and construct a dedicated transmission main and valve vaults that connect the tank to hydraulic grade Zone 2A is approximately \$9,036,000.

Table 18 - Replace Existing Tank

ITEM	COST
16-inch Transmission Main	\$ 1,446,000
2.0 Million Gallon Tank	\$ 4,899,000
Tank Mixing	\$ 109,000
Probable Construction Cost	\$ 6,454,000
Construction Contingency	\$ 968,000
Engineering, Legal, Administrative	\$ 1,614,000
Total Project Budget	\$ 9,036,000

3. Operation and Maintenance

Operation and maintenance costs for the tank includes power for mixing and telemetry. O&M costs for the transmission main include power for valve vaults, control and main line valve maintenance and hydrant maintenance. The project would not increase personnel costs since it does not add additional facilities or equipment that require greater operator attention.

Table 19 – Probable O&M Costs

ITEM	COST
Energy – Vaults	\$ 3,200
Energy – Tank Mixing	\$ 2,800
Hydrant Maintenance	\$ 400
Valve Maintenance	\$ 1,100
Transducers	\$ 200
Annual O&M Cost	\$ 7,700

V. SELECTION OF AN ALTERNATIVE

A. LIFE CYCLE COST ANALYSIS

1. Telemetry and Control System

It is anticipated the telemetry and control system installed for either tank alternative would need to be upgrade or replaced every 10-years. Based on a current value of \$15,000, it is anticipated that the cost to replace the system in 10-years is approximately \$20,600 based on 3.2% rate of inflation. The probable 20-year cost is \$28,400. Total 20-year life cycle cost is therefore likely \$49,000.

2. Rehabilitate Existing Tank

The existing tank is nearing the end of its functional life. If it is rehabilitated, the existing tank will likely need replacing within the next 20-years. Based on a current cost of \$6,859,000 to replace the existing tank, and 3.2% interest, the cost to replace the tank in 20-years is likely \$12,997,000. 20-year O&M costs are likely \$2,584,000. Table 20 summarizes the probable 20-year cost of rehabilitating the existing tank.

Table 20 - 20-Year Tank Repair

ITEM	20-YEAR COST
Rehabilitate Existing Tank	\$ 3,235,000
O&M Costs	\$ 2,584,000
Telemetry Costs	\$ 49,000
Replace Tank	\$ 12,997,000
Total Life Cycle	\$ 18,865,000

3. Replace Existing Tank

Table 21 summarizes the probable cost to replace the existing tank, operate and maintain the improvements, and recoat the tank in 20-years.

Table 21 - 20-Year Tank Replacement

ITEM	20-YEAR COST
Replace Existing Tank	\$ 9,036,000
O&M Costs	\$ 2,584,000
Telemetry Costs	\$ 49,000
Coat Tank	\$ 2,403,448
Total Life Cycle	\$ 14,072,448

B. NON-MONITORY FACTORS

Both options have the same environmental factors since they both contemplate work in the same locations.

1. Rehabilitate Existing Tank

Rehabilitating the existing tank does not address pressure equalization issues in the existing system. In order for the tank to operate properly, the tank would need a dedicated transmission main that connects the tank directly to a lower hydraulic grade zone. Valving at the tank would allow it to supplement fire demands in the upper zone (Zone 1), similar to current operation.

2. Replace Existing Tank

Replacing the existing tank taller, higher volume tank provide system pressure equalization in Zone 1, improved system performance in lower zones, and supplemental storage needed for fire protection.

VI. PROPOSED PROJECT

A. PRELIMINARY PROJECT DESIGN

The recommended alternative is to replace the existing Brickyard Road tank with elevated storage including transmission main and related valve vaults. The proposed project includes the following:

1. 2.0 MG elevated storage tank.
2. 16-inch inlet and outlet lines to the tank
3. 16-inch transmission main from Yerkes Road to the tank site.
4. Altitude valve on the inlet line that causes the tank to operate between high and low operating levels and controls the rate of flow into the tank.
5. Valve vault at Brickyard Road that includes a pressure reducing valve, check valve and bypass lines. The check valve will control flow on the inlet line so it only allows flow in to the tank during normal operation. The pressure reducing valve allows flow into Zone 1 on reversal of hydraulic grade in order to supplement peak hour and fire flow demands.
6. Valve vault at the intersection of Brickyard Road and Purdy Road. Initially the vault will include a check valve that allows flow into Zone 1 from the tank but prevents Zone 1 from filling the tank through the outlet pipe. This connection is needed to supplement peak hour and fire demands in Zone 1.

7. 16-inch transmission main from the tank site to CFTL Road.
8. Valve vault on CFTL Road that include valves to reduce pressure to new hydraulic grade zone, Zone 2A, and to reduce pressure to Zone 2.
9. 12-inch water main on CFTL Road and New Michigan Road including a pressure reducing valve vault at CR 41 on New Michigan Road. (Note, this portion of the project to be completed under an incentive zoning agreement by a local developer. Costs are not included in the budgets discussed in this report.)
7. Adjust the existing control valves between the hydraulic grade zones to favor flow through the new tank.

The proposed project replaces an existing water storage tank that is normally locked out of the system and provides distribution system improvements consistent with the 2002 *Master Plan*. The project does not include new sources of supply, treatment or pumping stations.

The project does not produce sanitary wastewater so wastewater treatment/reuse systems are not contemplated.

Solid waste produced by the project is temporary in nature and consistent with normal construction activities. Site work associated with the tank will be balanced. Excavations necessary for the tank will be offset by equal amounts of fill. Likewise, soil removed for installing the transmission main will be returned to the trench.

Storm water will be controlled utilizing methods called for in the NYSDEC manual of practice. Flow paths will be returned to pre-construction conditions.

B. PROJECT SCHEDULE

The following is a preliminary project schedule.

	<u>Completion</u>
PER Submittal	August 2016
DOH & Funding Agency Review Submittal	August 2016
SEQR Process	September 2016
Bonding & Short Term Funding	December 2017
Easements	January 2018
Design	July 2018

<i>(Continued)</i>	<u>Completion</u>
Bidding & Award	August 2018
Construction – Substantial Complete	June 2019
Construction – Final Complete	August 2019

C. PERMITS

The following permits are anticipated for the project.

1. Joint Application
 - a. NYS DEC Wetlands / Stream Disturbance / Storm Water Permit
 - b. USACE Wetlands / Stream Disturbance
2. Ontario County Highway
3. Town of Canandaigua Highway
4. Department of Health
5. FAA (water tank lighting)

D. SUSTAINABILITY (NOT APPLICABLE)

The project utilizes traditional, durable pipeline and tank materials designed longevity.

E. OPINION OF PROBABLE COST

The probable project budget is approximately \$9,036,000 as shown in Table 18.

F. ANNUAL OPERATING BUDGET

2015 financial data for the CFWD is included in Appendix E. The financial data includes a breakdown of income, annual O&M costs, debt repayments, reserves and budgeted capital project costs for 2016.

1. Income: CFWD income is based on an ad valorem tax rate and usage rate. The 2016 ad valorem tax rate is \$0.41/\$1,000 of assessed value. The usage rate includes a base fee plus a rate per thousand gallons of water used. The rate per thousand is based on meter size. The proposed project will not add additional users to the CFWD so will not result in additional user based income. The current rate schedule is included in Appendix E.
2. Annual O&M Cost: The proposed project is the replacement of an existing tank with a new tank and will incorporate similar electrical demands for monitoring tank level and

telecommunications. Therefore no changes to budgeted O&M are anticipated for the project.

3. Debt Repayment: Improvements to the CFWD are assessed on an ad valorem basis. CFWD is a consolidated district consisting of service areas with debt service from the original districts. Financial data in Appendix E shows the debt service by area.

The anticipated project cost is \$9,036,000. The project will benefit the entire CFWD and will increase the annual debt service paid by each customer. The entire district contains an estimated 8,150 EDU. Table 22 is a breakdown of EDU by tax identification property class (see also Appendix F) and is based on meter reading data from August 2015 to June 2016. The calculated annual water use for a 1 family residence is 48,980 gallons. The number of EDU by tax account property class code was calculated by dividing the annual meter read water use by 48,890 gallons. The anticipated cost per EDU based on conventional financing over 30 years and 3% interest is \$56.57 per year; at an interest rate of 4.5% the cost is \$68.07 per year.

VII. CONCLUSION

Town of Farmington's Brickyard Road tank is currently locked out of the distribution system only providing hydraulic benefit to the rest of the system during peak hour and fire demands. Since the tank is locked out of the system, tank water quality steadily degrades creating a potential for poor quality water to be introduced into the system during peak hour and fire demands.

Replacing the tank and constructing a dedicated transmission main will:

1. improve system performance by buffering peak hour and fire demand;
2. reduce wide changes in system pressure during normal daily changes in demand;
3. provide additional storage for fire demands; and,
4. improve tank water quality by promoting flow through and mixing in the tank.

The proposed project provides similar or better hydraulic benefit to the entire distribution system than the *New Michigan/Yerkes Road Transmission Main* improvements recommended in the 2002 Master Plan. The probable project cost budget for the recommended improvement is \$9,036,000.

Table 22 - CFWD EDU

PROBABLE PROJECT BUDGET

Town of Farmington Brickyard Rd Tank
PROBABLE PROJECT BUDGET - REPLACE TANK
(projected to 2018)

ITEM	COST
16-inch Transmission Main	\$ 1,446,000
2.0 Million Gallon Tank	\$ 4,899,000
Tank Mixing	\$ 109,000
Probable Construction Cost	\$ 6,454,000
Construction Contingency	\$ 968,000
Engineering, Legal, Administrative	\$ 1,614,000
Total Project Budget	\$ 9,036,000

Loan Term (years)	30
Annual Rate	4.50%
Annual Payment	\$ 554,734
Total EDU	8,150
Cost per EDU	\$ 68.07

Loan Term (years)	30
Annual Rate	3.00%
Annual Payment	\$ 461,010
Total EDU	8,150
Cost per EDU	\$ 56.57

Subject: Brisk Yard Road Report
Attachments: Figure 4 - Environmental Mapper Output.pdf

Greg / Dave:

Looking through the report it does not look like the figure references were changed when the report was updated to the EFC format. In your response to Sheryl, include the following.

In reviewing the comment regarding Figure 4, it was determined that figure referenced need updating. Update the figure references as follows.

1. Pages 1, 5, 18 and 21. Change Figure 2 references to Figure 3.
2. Page 1, Change the reference to Figure 3 under Environmental Resources Present to read Figure 4. (Figure 4 was not included in the report and is attached.)
3. Page 12 and 13. Change Figure 4 references to Figure 2
4. Page 16. Delete the reference to Figure 3.

Derek Anderson, P.E.
